

Patient's name :- Sajan Kumari Yadav

Patient's address :- Itaharba-6, Saptari, Nepal

Disease's name :- Plantar Fasciitis

Neurobiomarker Testing

Reason :- Plantar fasciitis occurs when a thick fibrous structure located in the sole of the foot called the plantar fascia becomes inflamed.

Treatment's name:- Synthetic stem cell therapy is a new and advanced technique that can help treat Plantar Fasciitis. This therapy uses synthetic stem cells created by bio-engineering, which function similar to natural stem cells but are more effective and safer. Treatment process- 1. Creation of artificial stem cells: Synthetic stem cells are prepared using biomaterials and biological factors in scientific laboratories. 2. Reducing inflammation and damage: These stem cells are injected into the body, which reduces inflammation and speeds up the repair process in the affected joints. 3. Rebuilding cartilage: Synthetic stem cells help create new cartilage (cushioned tissue), which increases flexibility in the joints and reduces pain. 4. Regulating the immune system: These cells moderate the body's immune response, thereby reducing autoimmune problems associated with osteoarthritis. 5. Long-term effect: Compared to natural stem cells, synthetic stem cells remain effective for a longer period of time and do not degrade quickly in the body.
